

## Sensor Interface Design with Worst Case Analysis - Volume 1

In this application, the worst case analysis for the temperature sensor interface circuit is performed. The circuit consists of a thin film Resistance Temperature Detector (RTD), op-amp and other passive devices in order to convert temperature to voltage and adjust voltage to the input voltage range of AD converter.

This worksheet shows the analysis to obtain the maximum and minimum output voltage from the temperature sensor circuit as volume 1.

## 1. Resistance Temperature Detector (RTD)

As the first step of the analysis, the thin film Resistance Temperature Detector's characteristic is reviewed in this section.

In this example, ZNI1000 is selected for a RTD.

Reference: Datasheet of ZNI1000 (Diodes Incorporated)

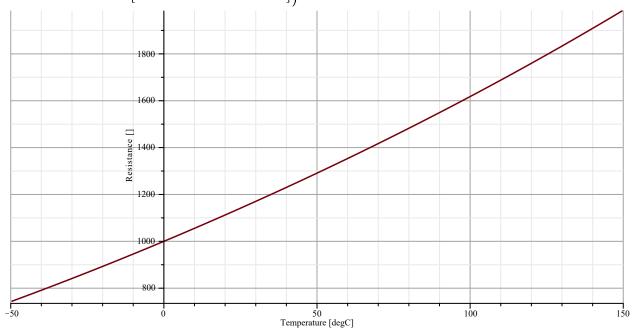

Based on the reference, the resistance of RTD is defined with the following equation.

$$\mathrm{Eq}_{\mathrm{RTD1}} := \mathrm{R}_{\mathrm{D}} = \mathrm{R}_{\mathrm{D0}} \cdot \left( \mathbf{1} + \mathrm{A} \cdot \mathrm{T} + \mathrm{B} \cdot \mathrm{T}^2 + \mathrm{C} \cdot \mathrm{T}^4 + \mathrm{D} \cdot \mathrm{T}^6 \right)$$

$$\mathsf{Par}_{\mathsf{RTD}} := \left[ \mathsf{R}_{\mathsf{D0}} = \mathsf{10}^3 \text{, A} = 5.485 \cdot \mathsf{10}^{-3} \text{, B} = 6.65 \cdot \mathsf{10}^{-6} \text{, C} = 2.805 \cdot \mathsf{10}^{-11} \text{, D} = -2.0 \cdot \mathsf{10}^{-17} \right]$$

Thus, the nominal characteristic of Sensor Resistance vs Temperature is shown as follow.

$$\label{eq:rhs_eq_RTD1_rate} $$\operatorname{Par}_{RTD}, T=-50..150, gridlines, labels = ["Temperature [degC]", "Resistance []" ], labeldirections = [horizontal, vertical]) = $$$$$$

The tolerance for Temperature is described by the following equation

$$\text{Eq}_{\text{RTD2}} \coloneqq \left\{ \begin{array}{ll} \textbf{0.4} + \textbf{0.028} \cdot \text{abs}(\textbf{T}) & \textbf{T} \leq \textbf{0} \\ \textbf{0.4} + \textbf{0.07} \cdot \text{abs}(\textbf{T}) & \text{otherwise} \end{array} \right.$$

Additionally, the long term stability is given as 0.1 % for 1000 h at 150 degC. Therefore, the max/min characteristic of Sensor resistance can be obtained with the following equation.

$$\mathsf{Eq}_{\mathsf{RTD3}} \coloneqq \mathsf{lhs}\big(\mathsf{Eq}_{\mathsf{RTD1}}\big) = (1 + 0.1) \cdot \mathsf{eval}\big(\mathsf{rhs}\big(\mathsf{Eq}_{\mathsf{RTD1}}\big), \big\lceil \mathsf{T} = \mathsf{T} + \mathsf{Eq}_{\mathsf{RTD2}} \big\rceil\big)$$

$$\mathsf{Eq}_{\mathsf{RTD4}} \coloneqq \mathsf{lhs}(\mathsf{Eq}_{\mathsf{RTD1}}) = (\mathsf{1} - \mathsf{0.1}) \cdot \mathsf{eval}(\mathsf{rhs}(\mathsf{Eq}_{\mathsf{RTD1}}), [\mathsf{T} = \mathsf{T} - \mathsf{Eq}_{\mathsf{RTD2}}])$$

So, the following plot shows the nominal and maximum, minimum characteristic.

$$\begin{split} & p_{\text{RTD1}} \coloneqq \text{plot}\big(\text{eval}\big(\text{rhs}\big(\text{Eq}_{\text{RTD1}}\big), \text{Par}_{\text{RTD}}\big), \, T = -50 \dots 150, \, \text{legend} = \text{"Nominal"}, \, \text{color} = \text{red}\big) \\ & p_{\text{RTD2}} \coloneqq \text{plot}\big(\text{eval}\big(\text{rhs}\big(\text{Eq}_{\text{RTD3}}\big), \, \text{Par}_{\text{RTD}}\big), \, T = -50 \dots 150, \, \text{legend} = \text{"Maximum"}, \, \text{color} = \text{blue}\big) \\ & p_{\text{RTD3}} \coloneqq \text{plot}\big(\text{eval}\big(\text{rhs}\big(\text{Eq}_{\text{RTD4}}\big), \, \text{Par}_{\text{RTD}}\big), \, T = -50 \dots 150, \, \text{legend} = \text{"Minimum"}, \, \text{color} = \text{green}\big) \end{split}$$

plots:-display([P<sub>RTD1</sub>, P<sub>RTD2</sub>, P<sub>RTD3</sub>], gridlines, axes = "framed",

labels = ["Temperature [degC]", "Resistance []"], labeldirections = [horizontal, vertical]) =

## 2. Output Voltage of Temperature Sensor Circuit

The output voltage  $V_{\varsigma}$  can be calculated with the following.

$$\mathrm{Eq_{vout}} := \mathrm{V_s} = \frac{\mathrm{R_D}}{\mathrm{R_O} + \mathrm{R_D}} \! \cdot \! \mathrm{V_{sup}}$$

The supply voltage  $\rm V_{sup}$  and the resistance  $\rm R_0$  are given as follow.

$$V_{sun} := 5$$
  $R_{o} := 1.5 \cdot 10^{3}$ 

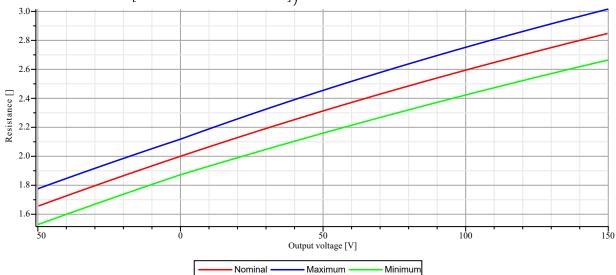

Thus, the following plot shows the output voltage of temperature sensor circuit for Nominal/Maximum/Minimum.

$$\begin{aligned} & p_{vout1} \coloneqq plot(eval(rhs(Eq_{vout}), [R_D = eval(rhs(Eq_{RTD1}), Par_{RTD})]), T = 50..150, \\ & legend = "Nominal", color = red) \end{aligned}$$

$$\begin{aligned} & p_{\text{vout2}} \coloneqq \text{plot}\big(\text{eval}\big(\text{rhs}\big(\text{Eq}_{\text{vout}}\big), \big[\text{R}_{\text{D}} = \text{eval}\big(\text{rhs}\big(\text{Eq}_{\text{RTD3}}\big), \text{Par}_{\text{RTD}}\big)\big]\big), \text{T= 50..150,} \\ & \text{legend} = \text{"Maximum", color = blue}\big) \end{aligned}$$

$$\begin{aligned} & p_{\text{vout3}} \coloneqq \text{plot}\big(\text{eval}\big(\text{rhs}\big(\text{Eq}_{\text{vout}}\big), \big[\text{R}_{\text{D}} = \text{eval}\big(\text{rhs}\big(\text{Eq}_{\text{RTD4}}\big), \text{Par}_{\text{RTD}}\big)\big]\big), \text{T= 50..150,} \\ & \text{legend} = \text{"Minimum", color} = \text{green}\big) \end{aligned}$$

plots:-display([ $p_{vout1}$ ,  $p_{vout2}$ ,  $p_{vout3}$ ], gridlines, axes = "framed", labels = ["Output voltage [V]", "Resistance []"], labeldirections = [horizontal, vertical]) =

## 3. Range of Output Voltage of Temperature Sensor Circuit

In order to do the worse case analysis of the op-amp circuit to adujst the input voltage for AD converter, the maximum/minimum output voltage of Temperature sensor circuit is calculated as follow. Regarding the range of sensing temperature, -30 to 70 [degC] is required in this case.

$$dat := [0, 0, 0, 0, 0, 0]$$

Nominal output voltage

$$\begin{aligned} & \mathsf{dat}[1] \coloneqq \mathsf{maximize}\big(\mathsf{eval}\big(\mathsf{rhs}\big(\mathsf{Eq}_{\mathsf{vout}}\big), \big[\mathsf{R}_{\mathsf{D}} = \mathsf{eval}\big(\mathsf{rhs}\big(\mathsf{Eq}_{\mathsf{RTD1}}\big), \mathsf{Par}_{\mathsf{RTD}}\big)\big]\big), \, \mathsf{T} = \, 30 \dots 70\big) \\ & \mathsf{dat}[2] \coloneqq \mathsf{minimize}\big(\mathsf{eval}\big(\mathsf{rhs}\big(\mathsf{Eq}_{\mathsf{vout}}\big), \big[\mathsf{R}_{\mathsf{D}} = \mathsf{eval}\big(\mathsf{rhs}\big(\mathsf{Eq}_{\mathsf{RTD1}}\big), \mathsf{Par}_{\mathsf{RTD}}\big)\big]\big), \, \mathsf{T} = \, 30 \dots 70\big) \end{aligned}$$

Maximum output voltage

$$\begin{aligned} & \mathsf{dat}[\,3] \coloneqq \mathsf{maximize}\big(\mathsf{eval}\big(\mathsf{rhs}\big(\mathsf{Eq}_{\mathsf{vout}}\big), \big[\,\mathsf{R}_{\mathsf{D}} = \mathsf{eval}\big(\mathsf{rhs}\big(\mathsf{Eq}_{\mathsf{RTD3}}\big), \mathsf{Par}_{\mathsf{RTD}}\big)\,\big]\big), \, \mathsf{T} = \, 30 \dots 70\big) \\ & \mathsf{dat}[\,4] \coloneqq \mathsf{minimize}\big(\mathsf{eval}\big(\mathsf{rhs}\big(\mathsf{Eq}_{\mathsf{vout}}\big), \big[\,\mathsf{R}_{\mathsf{D}} = \mathsf{eval}\big(\mathsf{rhs}\big(\mathsf{Eq}_{\mathsf{RTD3}}\big), \mathsf{Par}_{\mathsf{RTD}}\big)\,\big]\big), \, \mathsf{T} = \, 30 \dots 70\big) \end{aligned}$$

Minimum output voltage

$$\texttt{dat[5]} \coloneqq \texttt{maximize}(\texttt{eval}(\texttt{rhs}(\texttt{Eq}_{\texttt{vout}}), \lceil \texttt{R}_{\texttt{D}} = \texttt{eval}(\texttt{rhs}(\texttt{Eq}_{\texttt{RTD4}}), \texttt{Par}_{\texttt{RTD}}) \rceil), \texttt{T} = 30..70)$$

$$\texttt{dat[6]} \coloneqq \texttt{minimize}\big(\texttt{eval}\big(\texttt{rhs}\big(\texttt{Eq}_{\texttt{vout}}\big), \big[\texttt{R}_{\texttt{D}} = \texttt{eval}\big(\texttt{rhs}\big(\texttt{Eq}_{\texttt{RTD4}}\big), \texttt{Par}_{\texttt{RTD}}\big)\big]\big), \texttt{T} = -30..70\big)$$

Thus, the range of output voltage of Temperature sensor circuit is obtained.

Maximum voltage: max(dat) = 2.578

Minimum voltage: min(dat) = 1.669
